

ABOUT GEOSTAIN

GEOSTAIN was developed originally for architects and designers to create product for concrete which is beautiful, but also safe for humans and the environment. Our team personally believes in choosing the environment over convenience and aesthetics, but realized that if we developed a product that could satisfy all of these factors it would revolutionize the green building movement. So we were inspired to create a concrete stain product that would offer architects, designers and homeowners a beautiful, yet environmentally-safer choice over the traditional acid-based stain products that are available.

We challenged our product development team (chemists, interior designers, and concrete and color experts) to create a stain product that would be environmentally friendly, extremely durable, easy to install and also offering a pallet of trend-setting colors to appeal to the most sophisticated customers. After some experimenting and lots of testing, our talented team of experts was able to bring to the market a product that we could be proud of.

GEOSTAIN is an environmentally safe water-based decorative concrete stain that produces stunning effects on virtually any interior or exterior concrete surface. GEOSTAIN application is simple, and requires no post application washing or hazardous waste cleanup like acid stains. GEOSTAIN can be applied to walls and floors.

At Bradley Hughes, we believe designers, contractors, architects, builders and homeowners should have a choice when it comes to selecting environmentally conscious flooring products.
